What is a Chart?

A chart is a graphical representation of data, used to visualize and communicate **information** effectively.

Why Use Charts?

Charts are powerful tools for communicating information, regardless of the **audience's** educational background, and help them easily understand the topic.

Purpose of Charts

Charts help to:

1. Simplify complex data
2. Identify trends and patterns
3. Compare data
4. Communicate insights

Common Applications

Charts are widely used in:

1. Business
2. Finance
3. Education
4. Research
5. Data Analysis
6. Stock Market
7. Healthcare

Types of Charts

1. Bar Chart
2. Column Chart
3. Pie Chart
4. Scatter Plot
5. Histogram
6. Line Chart
7. Area Chart
8. BubbleChart
9. DonutChart
10. Funnel
11. Waterfall
12. Treemap
13. Stock

Choosing the Right Chart

The choice of chart doesn't solely depend on the data, but rather on what we want to show the end-user.

For example, to compare annual sales across 3 regions, a **Bar** Chart or **Column** Chart would be more effective than a **Pie Chart**, as it facilitates easy comparison between regional sales.

Data

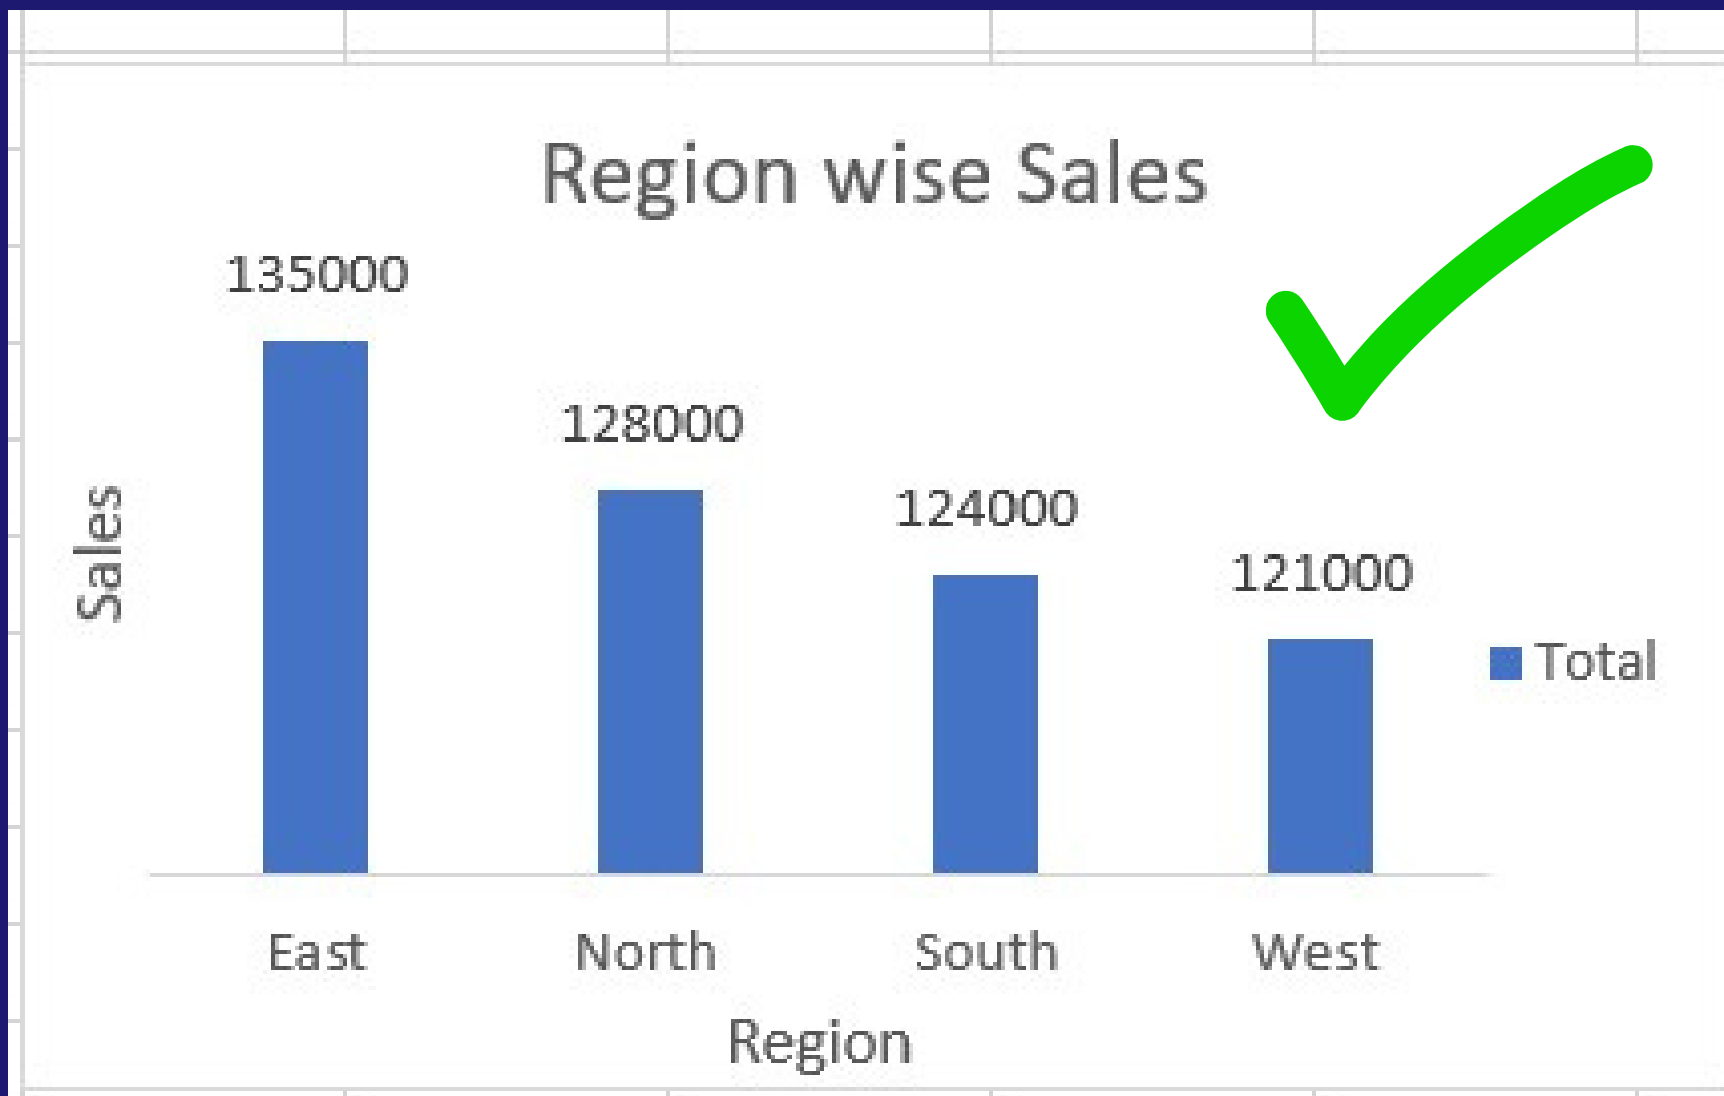

Region	Annual Sales
North	128000
East	135000
South	124000
West	121000

Pivot table

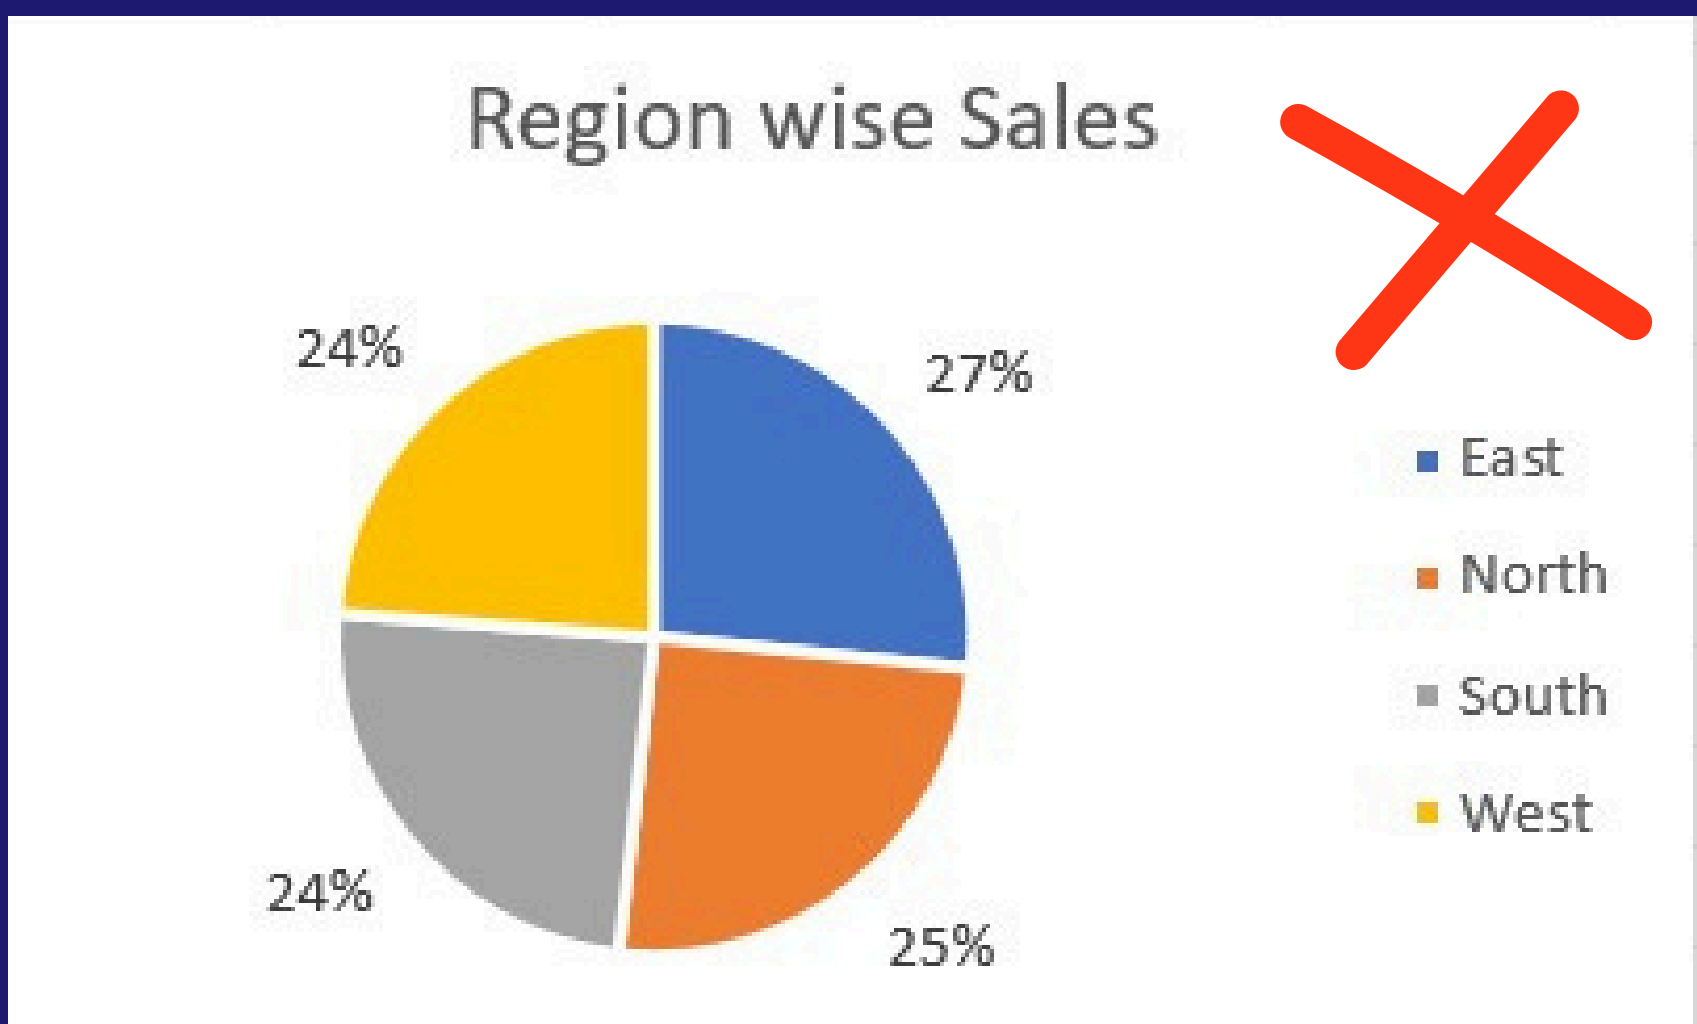

Row Labels ▼	Sum of Sales
East	135000
North	128000
South	124000
West	121000

Column Chart

Pie Chart

Column Chart vs Bar Chart

When deciding between a Column Chart and a Bar Chart, consider the following:

Key Difference

Orientation: Column Charts have vertical bars, while Bar Charts have horizontal bars.

When to Use Each

Bar Chart:

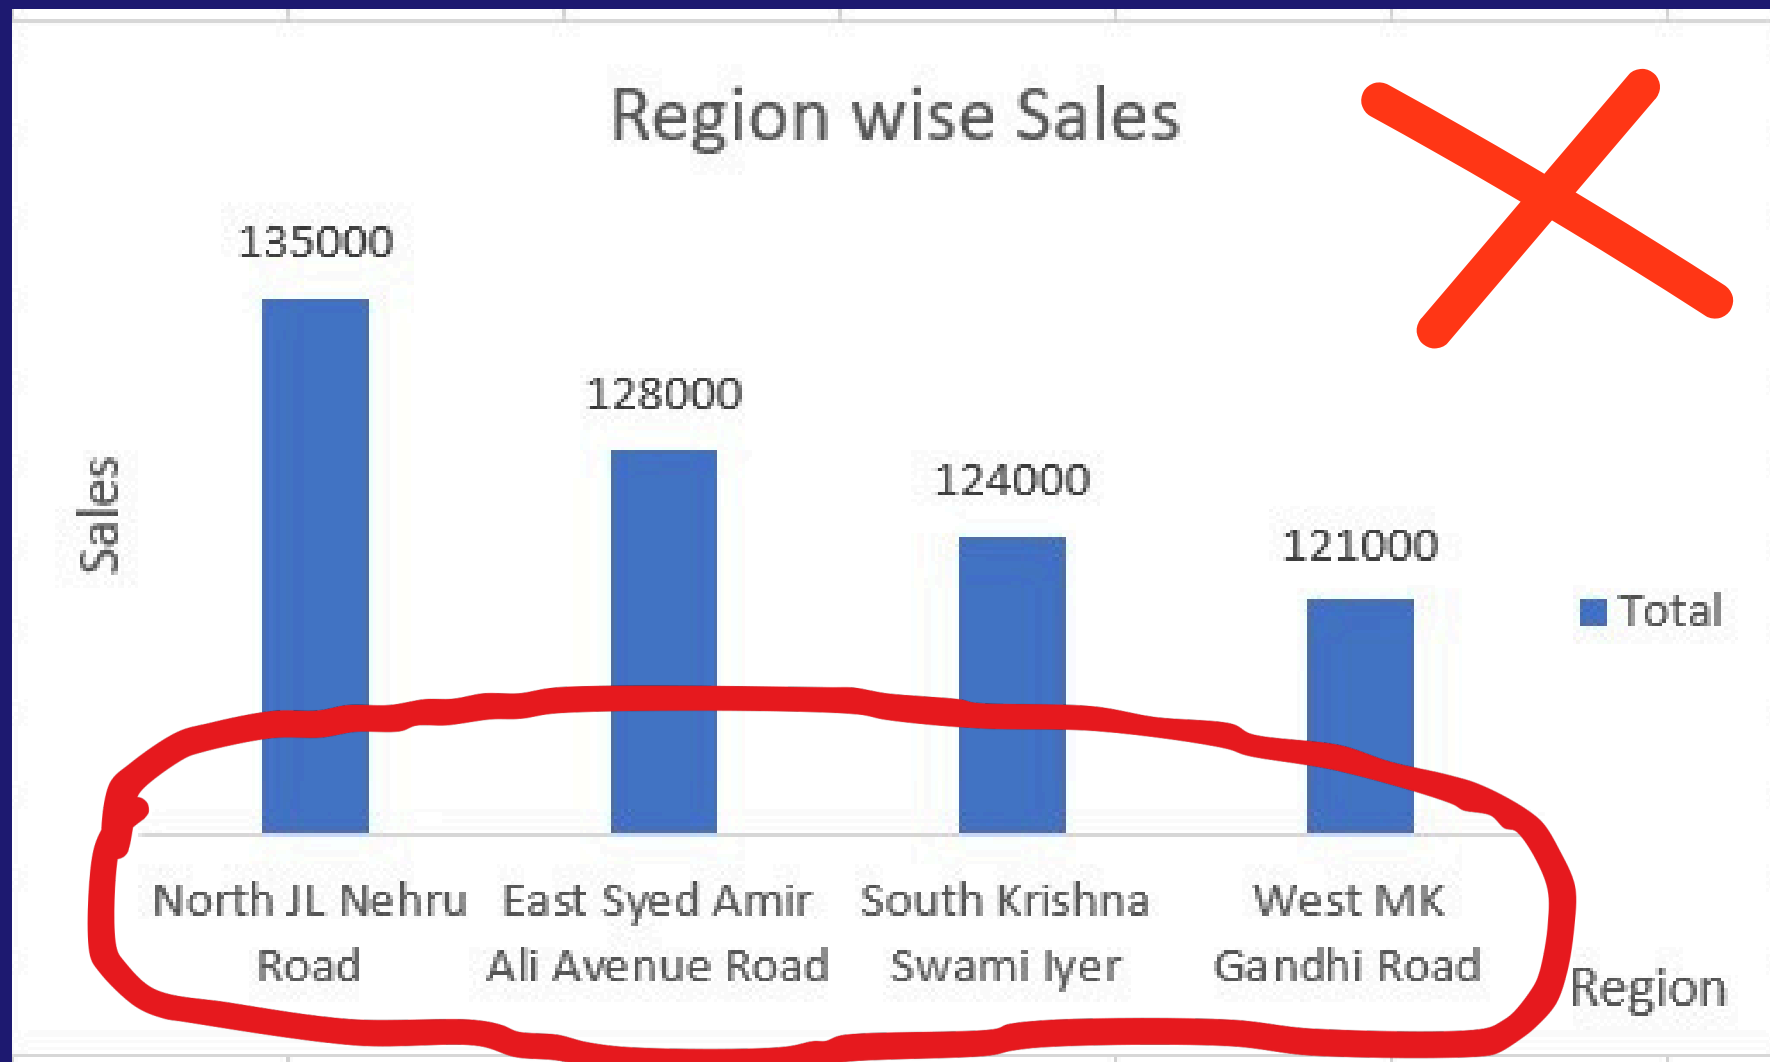

Ideal when:- Category names are long (e.g., region names).

Column Chart:

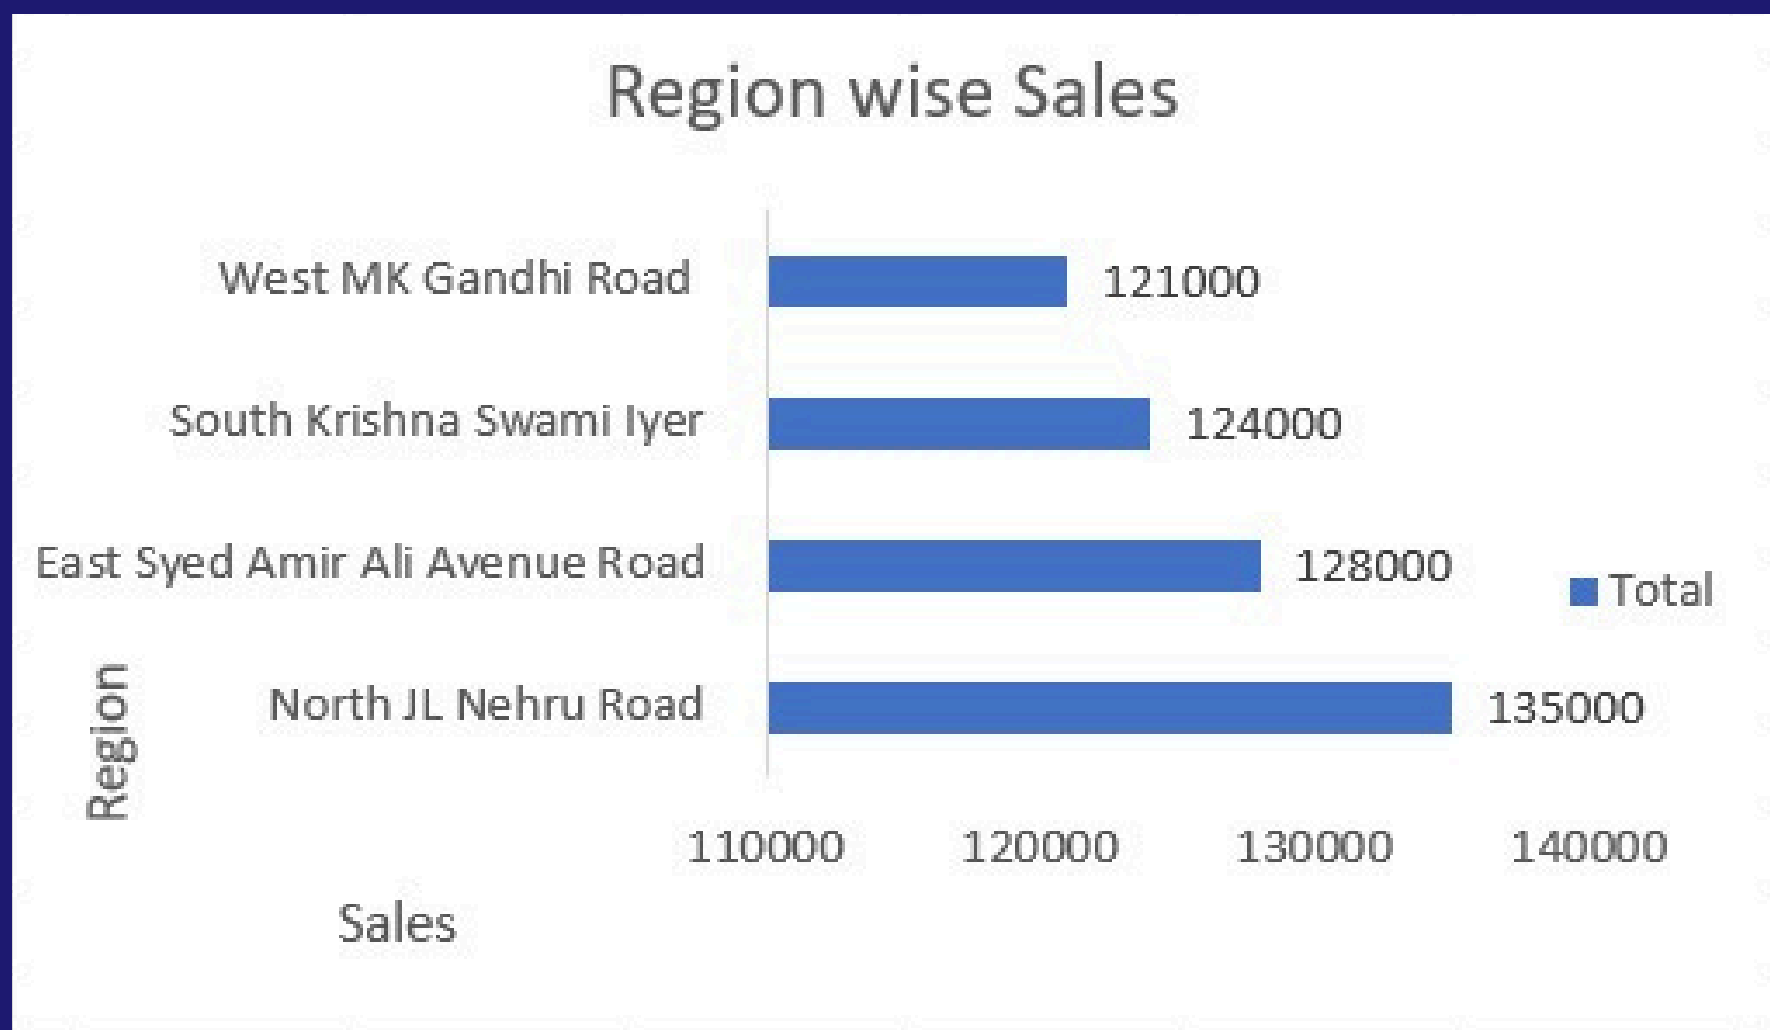

Suitable when:- Category names are short.

Column Chart

Bar Chart

Why Bar Chart is Preferred in the above example

Readability: With long region names on the X-axis in a Column Chart, the labels might not fit in a single line, making them hard to read.

Clarity: A Bar Chart allows the long region names to be displayed clearly on the Y-axis, improving overall readability.

Thank you for exploring data visualization
